Inheritance I: Understanding inheritance, "is a" relationship

Implement a **Person** class and a **Employee** class. The Person class should have the properties such as name, surname, social security number, address, phone, marital status, nationality. The Employee class should have the same properties with **class Person** however add some more properties for separating Employee from Person such as salary, office, office phone number, title. Write a drive program to test your classes.

Hint: use inheritance hierarchy as "Employee is a Person" for your codes.
