- High availability can be achieved when only a subset of the nodes is used in the computation and the rest is used as a backup in case of failure.
- In cases when one of the main objectives of the cluster is high availability, the middleware will also support features that enable the cluster services for recovery from failure and fault tolerance among all nodes of the cluster.
- For example, the middleware should offer the necessary infrastructure for checkpointing.

environment

 High availability can be achieved when only a subset of the nodes is used in the computation and the rest is used as a backup in case of failure.

clusters can also be used to provide high-availability

- In cases when one of the main objectives of the cluster is high availability, the middleware will also support features that enable the cluster services for recovery from failure and fault tolerance among all nodes of the cluster.
- For example, the middleware should offer the necessary infrastructure for checkpointing.
- A checkpointing scheme makes sure that the process state is saved periodically.

Cluster Examples

 In addition to providing high-performance computing, clusters can also be used to provide high-availability environment

- High availability can be achieved when only a subset of the nodes is used in the computation and the rest is used as a backup in case of failure.
- In cases when one of the main objectives of the cluster is high availability, the middleware will also support features that enable the cluster services for recovery from failure and fault tolerance among all nodes of the cluster.
- For example, the middleware should offer the necessary infrastructure for checkpointing.
- A checkpointing scheme makes sure that the process state is saved periodically.
- In the case of node failure, processes on the failed node can be restarted on another working node.
