# Continuous Uniform Distribution I

**Uniform distribution** (Rectangular distribution): The density function of the continuous uniform random variable  $X$  on the interval  $[A, B]$  is

$$f(x; A, B) = \begin{cases} \frac{1}{B-A}, & A \leq x \leq B \\ 0, & \text{elsewhere} \end{cases}$$

# Continuous Uniform Distribution I

**Uniform distribution** (Rectangular distribution): The density function of the continuous uniform random variable  $X$  on the interval  $[A, B]$  is

$$f(x; A, B) = \begin{cases} \frac{1}{B-A}, & A \leq x \leq B \\ 0, & \text{elsewhere} \end{cases}$$

# Continuous Uniform Distribution I

**Uniform distribution** (Rectangular distribution): The density function of the continuous uniform random variable  $X$  on the interval  $[A, B]$  is

$$f(x; A, B) = \begin{cases} \frac{1}{B-A}, & A \leq x \leq B \\ 0, & \text{elsewhere} \end{cases}$$

**Figure:** The density function for a random variable on the interval  $[1, 3]$ .

# Continuous Uniform Distribution I

**Uniform distribution** (Rectangular distribution): The density function of the continuous uniform random variable  $X$  on the interval  $[A, B]$  is

$$f(x; A, B) = \begin{cases} \frac{1}{B-A}, & A \leq x \leq B \\ 0, & \text{elsewhere} \end{cases}$$

**Example.** Let  $T$  be the waiting for a bus when a bus comes every 30 min,

$$f(t) = \frac{1}{30}, \quad 0 \leq t \leq 30$$

**Figure:** The density function for a random variable on the interval  $[1, 3]$ .

# Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

# Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .
  - i What is the probability density function?

# Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .
  - i What is the probability density function?

## Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \textit{elsewhere} \end{cases}$$

## Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \textit{elsewhere} \end{cases}$$

ii What is the probability that any given conference lasts at least 3 hours?

## Continuous Uniform Distribution II

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \textit{elsewhere} \end{cases}$$

ii What is the probability that any given conference lasts at least 3 hours?

## Continuous Uniform Distribution II

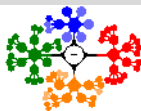

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \textit{elsewhere} \end{cases}$$

ii What is the probability that any given conference lasts at least 3 hours?

$$P(X \geq 3) = \int_3^4 \frac{1}{4} dx = \frac{1}{4}$$

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \text{elsewhere} \end{cases}$$

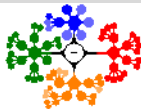

ii What is the probability that any given conference lasts at least 3 hours?

$$P(X \geq 3) = \int_3^4 \frac{1}{4} dx = \frac{1}{4}$$

- **Theorem 6.1:**

The mean and variance of the uniform distribution are

$$\mu = \frac{A + B}{2}, \quad \sigma^2 = \frac{(B - A)^2}{12}$$

- **Example 6.1:** It is assumed that length  $X$  of a conference has a uniform distribution on the interval  $[0, 4]$ .

i What is the probability density function?

$$f(x) = \begin{cases} \frac{1}{4}, & 0 \leq x \leq 4 \\ 0, & \textit{elsewhere} \end{cases}$$

ii What is the probability that any given conference lasts at least 3 hours?

$$P(X \geq 3) = \int_3^4 \frac{1}{4} dx = \frac{1}{4}$$

- **Theorem 6.1:**

The mean and variance of the uniform distribution are

$$\mu = \frac{A + B}{2}, \quad \sigma^2 = \frac{(B - A)^2}{12}$$

- Mean is at the center of the range as we would expect.

# Normal Distribution I

- The most important continuous probability distribution in the entire field of statistics is the **normal distribution**.

# Normal Distribution I

- The most important continuous probability distribution in the entire field of statistics is the **normal distribution**.
- The **normal curve** describes approximately many phenomena that occur in nature, industry and research (human height, measurement errors, stock market!, etc.).

## Some Continuous Probability Distributions

Continuous Uniform  
Distribution

Areas Under the Normal  
Curve

Applications of the Normal  
Distribution

# Normal Distribution I

- The most important continuous probability distribution in the entire field of statistics is the **normal distribution**.
- The **normal curve** describes approximately many phenomena that occur in nature, industry and research (human height, measurement errors, stock market!, etc.).
- In 1733, Abraham DeMoivre developed the mathematical equation of the normal curve.

- The most important continuous probability distribution in the entire field of statistics is the **normal distribution**.
- The **normal curve** describes approximately many phenomena that occur in nature, industry and research (human height, measurement errors, stock market!, etc.).
- In 1733, Abraham DeMoivre developed the mathematical equation of the normal curve.
- The normal distribution is often referred to as the **Gaussian distribution**, in honour of Karl Friedrich Gauss (1777-1855), who also derived its equation from a study of errors in repeated measurements of the same quantity.

- The most important continuous probability distribution in the entire field of statistics is the **normal distribution**.
- The **normal curve** describes approximately many phenomena that occur in nature, industry and research (human height, measurement errors, stock market!, etc.).
- In 1733, Abraham DeMoivre developed the mathematical equation of the normal curve.
- The normal distribution is often referred to as the **Gaussian distribution**, in honour of Karl Friedrich Gauss (1777-1855), who also derived its equation from a study of errors in repeated measurements of the same quantity.
- The term normal distribution is a historical accident because there is nothing particularly normal about the normal distribution and nor is there anything abnormal about other distribution.

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

**Figure:** The normal curve.

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

**Figure:** The normal curve.

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

**Figure:** The normal curve.

- Notes:

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

**Figure:** The normal curve.

- Notes:

- $(x - \mu)^2$  is squared distance from the mean

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

**Figure:** The normal curve.

- Notes:

- $(x - \mu)^2$  is squared distance from the mean
- $e^{-\frac{1}{2\sigma^2}(x-\mu)^2}$  get smaller as  $(x - \mu)^2$  gets larger

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

**Figure:** The normal curve.

- Notes:

- $(x - \mu)^2$  is squared distance from the mean
- $e^{-\frac{1}{2\sigma^2}(x-\mu)^2}$  get smaller as  $(x - \mu)^2$  gets larger
- How fast it gets small depends on  $\sigma$ . Faster for small  $\sigma$ .

## Normal Distribution II

- Normal Distribution:

The density function of the normal random variable  $X$ , with mean  $\mu$  and variance  $\sigma^2$  is

$$n(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}, \quad -\infty < x < \infty$$

A continuous random variable  $X$  having the bell-shaped distribution of Fig. 2 is called a **normal random variable**.

**Figure:** The normal curve.

- Notes:

- $(x - \mu)^2$  is squared distance from the mean
- $e^{-\frac{1}{2\sigma^2}(x-\mu)^2}$  get smaller as  $(x - \mu)^2$  gets larger
- How fast it gets small depends on  $\sigma$ . Faster for small  $\sigma$ .
- The term  $\frac{1}{\sqrt{2\pi}\sigma}$  makes sure  $\int_{-\infty}^{\infty} n(x; \mu, \sigma) dx = 1$

- 4 The normal curve approaches the horizontal axis asymptotically as we proceed in either direction away from the mean.
- 5 The total area under the curve and above the horizontal axis is equal to 1.
- 6 Both tails become dramatically thin beyond  $\pm 3\sigma$  from the mean  $\mu$ .

# Normal Distribution V

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.

# Normal Distribution V

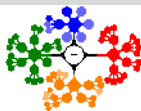

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.
- Assuming battery lives are normally distributed,

# Normal Distribution V

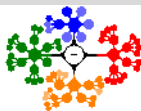

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.
- Assuming battery lives are normally distributed,
- Find the probability that a given battery will last less than 2.3 years;

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.
- Assuming battery lives are normally distributed,
- Find the probability that a given battery will last less than 2.3 years;
- Solution:

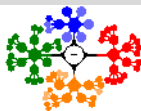

$$P(X < 2.3) = \int_{-\infty}^{2.3} \frac{1}{\sqrt{2\pi}0.5} e^{-\frac{1}{2 \cdot 0.5^2} (x-3)^2} dx$$

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.
- Assuming battery lives are normally distributed,
- Find the probability that a given battery will last less than 2.3 years;
- Solution:

$$P(X < 2.3) = \int_{-\infty}^{2.3} \frac{1}{\sqrt{2\pi}0.5} e^{-\frac{1}{2 \cdot 0.5^2} (x-3)^2} dx$$

- Difficult to solve!

- A certain type of battery lasts on average 3 years with a standard deviation of 0.5 years.
- Assuming battery lives are normally distributed,
- Find the probability that a given battery will last less than 2.3 years;
- Solution:

$$P(X < 2.3) = \int_{-\infty}^{2.3} \frac{1}{\sqrt{2\pi}0.5} e^{-\frac{1}{2 \cdot 0.5^2} (x-3)^2} dx$$

- Difficult to solve!
- Then, tabulation of normal curve areas is necessary.

## Areas Under the Normal Curve I

- The probability of the random variable  $X$  assuming a value between  $x_1$  and  $x_2$ .

$$P(x_1 < X < x_2) = \int_{x_1}^{x_2} n(x; \mu, \sigma) dx = \frac{1}{\sqrt{2\pi}\sigma} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$

# Areas Under the Normal Curve I

- The probability of the random variable  $X$  assuming a value between  $x_1$  and  $x_2$ .

$$P(x_1 < X < x_2) = \int_{x_1}^{x_2} n(x; \mu, \sigma) dx = \frac{1}{\sqrt{2\pi}\sigma} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$

- The area under the curve between any two ordinates must also depend on the values  $\mu$  and  $\sigma$ .

## Areas Under the Normal Curve I

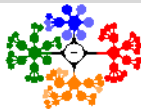

- The probability of the random variable  $X$  assuming a value between  $x_1$  and  $x_2$ .

$$P(x_1 < X < x_2) = \int_{x_1}^{x_2} n(x; \mu, \sigma) dx = \frac{1}{\sqrt{2\pi}\sigma} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$

- The area under the curve between any two ordinates must also depend on the values  $\mu$  and  $\sigma$ .

## Areas Under the Normal Curve I

- The probability of the random variable  $X$  assuming a value between  $x_1$  and  $x_2$ .

$$P(x_1 < X < x_2) = \int_{x_1}^{x_2} n(x; \mu, \sigma) dx = \frac{1}{\sqrt{2\pi}\sigma} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$

- The area under the curve between any two ordinates must also depend on the values  $\mu$  and  $\sigma$ .

**Figure:**  $P(x_1 < X < x_2)$  : area of the shaded region.

## Areas Under the Normal Curve I

- The probability of the random variable  $X$  assuming a value between  $x_1$  and  $x_2$ .

$$P(x_1 < X < x_2) = \int_{x_1}^{x_2} n(x; \mu, \sigma) dx = \frac{1}{\sqrt{2\pi}\sigma} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$

- The area under the curve between any two ordinates must also depend on the values  $\mu$  and  $\sigma$ .

# Areas Under the Normal Curve V

- Usage of the Table A.4;

# Areas Under the Normal Curve V

- Usage of the Table A.4;
  - The entries in the table are the areas under the standard normal curve between the mean,  $z = 0$ , and  $z = X$ .

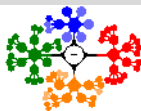

# Areas Under the Normal Curve V

- Usage of the Table A.4;
  - The entries in the table are the areas under the standard normal curve between the mean,  $z = 0$ , and  $z = X$ .
  - The first column represents the values of  $z$  from 0.0 to 3.4 by increment 0.1,

- Usage of the Table A.4;
  - The entries in the table are the areas under the standard normal curve between the mean,  $z = 0$ , and  $z = X$ .
  - The first column represents the values of  $z$  from 0.0 to 3.4 by increment 0.1,
  - and the first row indicates the second digit under the decimal of the corresponding values of  $z$  according to the column values.

- Usage of the Table A.4;
  - The entries in the table are the areas under the standard normal curve between the mean,  $z = 0$ , and  $z = X$ .
  - The first column represents the values of  $z$  from 0.0 to 3.4 by increment 0.1,
  - and the first row indicates the second digit under the decimal of the corresponding values of  $z$  according to the column values.
  - Suppose we want to find the area between 0 and 1.23, then all we need to do is to read the entry where the row of 1.2 and the column of 0.03 come across.

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

$$i) P(Z > k) = 0.3015$$

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

$$i) P(Z > k) = 0.3015$$

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

$$i \ P(Z > k) = 0.3015$$

$$P(Z < k) = 1 - P(Z > k) = 1 - 0.3015 = 0.6985 \Rightarrow k = 0.52$$

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

i  $P(Z > k) = 0.3015$

$$P(Z < k) = 1 - P(Z > k) = 1 - 0.3015 = 0.6985 \Rightarrow k = 0.52$$

ii  $P(k < Z < -0.18) = 0.4197$

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

i  $P(Z > k) = 0.3015$

$$P(Z < k) = 1 - P(Z > k) = 1 - 0.3015 = 0.6985 \Rightarrow k = 0.52$$

ii  $P(k < Z < -0.18) = 0.4197$

## Areas Under the Normal Curve VI

**Example 6.3:** Given a standard normal distribution, find the value of  $k$  such that

i  $P(Z > k) = 0.3015$

$$P(Z < k) = 1 - P(Z > k) = 1 - 0.3015 = 0.6985 \Rightarrow k = 0.52$$

ii  $P(k < Z < -0.18) = 0.4197$

$$P(Z < -0.18) - P(Z < k) = 0.4286 - P(Z < k) = 0.4197 \Rightarrow k = -2.37$$

**Figure:** Areas for Example 6.3.

## Areas Under the Normal Curve VII

- **Example 6.4:** Given a random variable  $X$  having a normal distribution with  $\mu = 50$  and  $\sigma = 10$ ,

## Areas Under the Normal Curve VII

- **Example 6.4:** Given a random variable  $X$  having a normal distribution with  $\mu = 50$  and  $\sigma = 10$ ,
- Find the probability that  $X$  assumes a value between 45 and 62.

## Areas Under the Normal Curve VII

- **Example 6.4:** Given a random variable  $X$  having a normal distribution with  $\mu = 50$  and  $\sigma = 10$ ,
- Find the probability that  $X$  assumes a value between 45 and 62.
- Solution:

## Areas Under the Normal Curve VII

- **Example 6.4:** Given a random variable  $X$  having a normal distribution with  $\mu = 50$  and  $\sigma = 10$ ,
- Find the probability that  $X$  assumes a value between 45 and 62.
- Solution:

## Areas Under the Normal Curve VII

- **Example 6.4:** Given a random variable  $X$  having a normal distribution with  $\mu = 50$  and  $\sigma = 10$ ,
- Find the probability that  $X$  assumes a value between 45 and 62.
- Solution:

$$x_1 = 45 \text{ and } x = 62 \xrightarrow{\text{transformation}} z_1 = \frac{45 - 50}{10} = -0.5, z_2 = \frac{62 - 50}{10} = 1.2$$

$$\begin{aligned} P(45 < X < 62) &= P(-0.5 < Z < 1.2) \\ &= P(Z < 1.2) - P(Z < -0.5) = 0.8849 - 0.3085 = 0.5764 \end{aligned}$$

**Figure:** Area for Example 6.4.

## Areas Under the Normal Curve VIII

- **Example 6.5** Given that a normal distribution with  $\mu = 300$  and  $\sigma = 50$ , find the probability that  $X$  assumes a value greater than 362.

## Areas Under the Normal Curve VIII

- **Example 6.5** Given that a normal distribution with  $\mu = 300$  and  $\sigma = 50$ , find the probability that  $X$  assumes a value greater than 362.
- Solution:

## Areas Under the Normal Curve VIII

- **Example 6.5** Given that a normal distribution with  $\mu = 300$  and  $\sigma = 50$ , find the probability that  $X$  assumes a value greater than 362.
- Solution:

## Areas Under the Normal Curve VIII

- **Example 6.5** Given that a normal distribution with  $\mu = 300$  and  $\sigma = 50$ , find the probability that  $X$  assumes a value greater than 362.
- Solution:

$$z = \frac{362 - 300}{50} = 1.24$$

$$\begin{aligned} -P(X > 362) &= P(Z > 1.24) = 1 - P(Z < 1.24) \\ &= 1 - 0.8925 = 0.1075 \end{aligned}$$

**Figure:** Area for Example 6.5.

- Using the Normal Curve in Reverse

Some Continuous  
Probability  
Distributions

Continuous Uniform  
Distribution

Normal Distribution

Areas Under the Normal  
Curve

Applications of the Normal  
Distribution

- **Using the Normal Curve in Reverse**
- We might want to find the value of  $z$  corresponding to a specified probability.

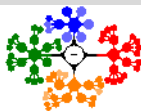

- **Using the Normal Curve in Reverse**
- We might want to find the value of  $z$  corresponding to a specified probability.
- The steps:

- **Using the Normal Curve in Reverse**
- We might want to find the value of  $z$  corresponding to a specified probability.
- The steps:
  - 1 Begin with a known area or probability.

- **Using the Normal Curve in Reverse**
- We might want to find the value of  $z$  corresponding to a specified probability.
- The steps:
  - 1 Begin with a known area or probability.
  - 2 Find the  $z$  values corresponding to the tabular probability that comes closest to the specified probability.

- **Using the Normal Curve in Reverse**
- We might want to find the value of  $z$  corresponding to a specified probability.
- The steps:
  - 1 Begin with a known area or probability.
  - 2 Find the  $z$  values corresponding to the tabular probability that comes closest to the specified probability.
  - 3 Determine  $x$  by rearranging the formula

$$z = \frac{x - \mu}{\sigma} \text{ to give } x = \sigma z + \mu$$

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has  
i 45% of the area to the left

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has  
i 45% of the area to the left

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has

i 45% of the area to the left

From Table A.3 we find  $P(Z < -0.13) = 0.45$ . Hence

$$x = 6 * (-0.13) + 40 = 39.22.$$

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has

i 45% of the area to the left

From Table A.3 we find  $P(Z < -0.13) = 0.45$ . Hence

$$x = 6 * (-0.13) + 40 = 39.22.$$

ii 14% of the are to the right

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has

i 45% of the area to the left

From Table A.3 we find  $P(Z < -0.13) = 0.45$ . Hence

$$x = 6 * (-0.13) + 40 = 39.22.$$

ii 14% of the are to the right

## Areas Under the Normal Curve X

**Example 6.6:** Given a normal distribution with  $\mu = 40$  and  $\sigma = 6$ , find the value of  $x$  that has

i 45% of the area to the left

From Table A.3 we find  $P(Z < -0.13) = 0.45$ . Hence

$$x = 6 * (-0.13) + 40 = 39.22.$$

ii 14% of the area to the right

From Table A.3, we find  $P(Z < 1.08) = 0.86$ . Hence

$$x = 6 * (1.08) + 40 = 46.48.$$

**Figure:** Areas for Example 6.6.

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.

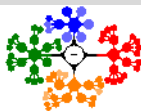

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.
- **Example 6.7:** A certain type of storage battery lasts, on average, 3.0 years, with a standard deviation of 0.5 year.

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.
- **Example 6.7:** A certain type of storage battery lasts, on average, 3.0 years, with a standard deviation of 0.5 year.
- Assuming that the battery lives are normally distributed, find the probability that a given battery will last less than 2.3 years.

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.
- **Example 6.7:** A certain type of storage battery lasts, on average, 3.0 years, with a standard deviation of 0.5 year.
- Assuming that the battery lives are normally distributed, find the probability that a given battery will last less than 2.3 years.
- Solution:

$$z = \frac{2.3 - 3}{0.5} = -1.4 \Rightarrow P(X < 2.3) = P(Z < -1.4) = 0.0808$$

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.
- **Example 6.7:** A certain type of storage battery lasts, on average, 3.0 years, with a standard deviation of 0.5 year.
- Assuming that the battery lives are normally distributed, find the probability that a given battery will last less than 2.3 years.
- Solution:

$$z = \frac{2.3 - 3}{0.5} = -1.4 \Rightarrow P(X < 2.3) = P(Z < -1.4) = 0.0808$$

## Applications of the Normal Distribution I

- Some of the many problems for which the normal distribution is applicable are treated in the following examples.
- **Example 6.7:** A certain type of storage battery lasts, on average, 3.0 years, with a standard deviation of 0.5 year.
- Assuming that the battery lives are normally distributed, find the probability that a given battery will last less than 2.3 years.
- Solution:

$$z = \frac{2.3 - 3}{0.5} = -1.4 \Rightarrow P(X < 2.3) = P(Z < -1.4) = 0.0808$$

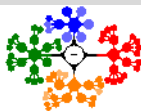

**Figure:** Area for Example 6.7.

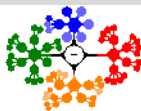

## Applications of the Normal Distribution II

- **Example 6.8:** An electrical firm manufactures light bulbs that have a life, before burn-out, that is normally distributed with mean equal to 800 hours and a standard deviation of 40 hours.

## Applications of the Normal Distribution II

- **Example 6.8:** An electrical firm manufactures light bulbs that have a life, before burn-out, that is normally distributed with mean equal to 800 hours and a standard deviation of 40 hours.
- Find the probability that a bulb burns between 778 and 834 hours.

## Applications of the Normal Distribution II

- **Example 6.8:** An electrical firm manufactures light bulbs that have a life, before burn-out, that is normally distributed with mean equal to 800 hours and a standard deviation of 40 hours.
- Find the probability that a bulb burns between 778 and 834 hours.
- Solution:

$$z_1 = \frac{778 - 800}{40} = -0.55 \text{ and } z_2 = \frac{834 - 800}{40} = 0.85$$

$$\begin{aligned} P(778 < X < 834) &= P(-0.55 < Z < 0.85) \\ &= P(Z < 0.85) - P(Z < -0.55) = 0.8023 - 0.2912 = 0.5111 \end{aligned}$$

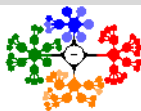

## Applications of the Normal Distribution II

- **Example 6.8:** An electrical firm manufactures light bulbs that have a life, before burn-out, that is normally distributed with mean equal to 800 hours and a standard deviation of 40 hours.
- Find the probability that a bulb burns between 778 and 834 hours.
- Solution:

$$z_1 = \frac{778 - 800}{40} = -0.55 \text{ and } z_2 = \frac{834 - 800}{40} = 0.85$$

$$\begin{aligned} P(778 < X < 834) &= P(-0.55 < Z < 0.85) \\ &= P(Z < 0.85) - P(Z < -0.55) = 0.8023 - 0.2912 = 0.5111 \end{aligned}$$

## Applications of the Normal Distribution II

- **Example 6.8:** An electrical firm manufactures light bulbs that have a life, before burn-out, that is normally distributed with mean equal to 800 hours and a standard deviation of 40 hours.
- Find the probability that a bulb burns between 778 and 834 hours.
- Solution:

$$z_1 = \frac{778 - 800}{40} = -0.55 \text{ and } z_2 = \frac{834 - 800}{40} = 0.85$$

$$\begin{aligned} P(778 < X < 834) &= P(-0.55 < Z < 0.85) \\ &= P(Z < 0.85) - P(Z < -0.55) = 0.8023 - 0.2912 = 0.5111 \end{aligned}$$

**Figure:** Area for Example 6.8.

## Applications of the Normal Distribution III

- **Example 6.9:** The buyer sets specifications on the diameter to be  $3.0 \pm 0.01$  cm.

## Applications of the Normal Distribution III

- **Example 6.9:** The buyer sets specifications on the diameter to be  $3.0 \pm 0.01$  cm.
- It is known that in the process the diameter of a ball bearing has a normal distribution with mean  $\mu = 3.0$  and standard deviation  $\sigma = 0.005$ .

## Applications of the Normal Distribution III

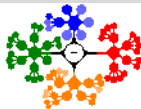

- **Example 6.9:** The buyer sets specifications on the diameter to be  $3.0 \pm 0.01$  cm.
- It is known that in the process the diameter of a ball bearing has a normal distribution with mean  $\mu = 3.0$  and standard deviation  $\sigma = 0.005$ .
- On the average, how many manufactured ball bearings will be scrapped?.

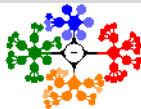

## Applications of the Normal Distribution III

- **Example 6.9:** The buyer sets specifications on the diameter to be  $3.0 \pm 0.01$  cm.
- It is known that in the process the diameter of a ball bearing has a normal distribution with mean  $\mu = 3.0$  and standard deviation  $\sigma = 0.005$ .
- On the average, how many manufactured ball bearings will be scrapped?.
- Solution:

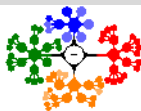

## Applications of the Normal Distribution III

- It is known that in the process the diameter of a ball bearing has a normal distribution with mean  $\mu = 3.0$  and standard deviation  $\sigma = 0.005$ .
- On the average, how many manufactured ball bearings will be scrapped?.

- Solution:

$$z_1 = \frac{2.99 - 3.0}{0.005} = -2.0$$

$$z_2 = \frac{3.01 - 3.0}{0.005} = 2.0$$

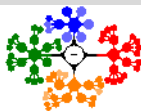

$$\Rightarrow P(2.99 < X < 3.01)$$

$$= P(-2.0 < Z < 2.0)$$

$$= 1 - 2 * P(Z < -2.0)$$

$$= 1 - 2 * 0.0228 = 0.9544$$

## Applications of the Normal Distribution III

- **Example 6.9:** The buyer sets specifications on the diameter to be  $3.0 \pm 0.01$  cm.
- It is known that in the process the diameter of a ball bearing has a normal distribution with mean  $\mu = 3.0$  and standard deviation  $\sigma = 0.005$ .
- On the average, how many manufactured ball bearings will be scrapped?.

- Solution:

$$z_1 = \frac{2.99 - 3.0}{0.005} = -2.0$$

$$z_2 = \frac{3.01 - 3.0}{0.005} = 2.0$$

$$\Rightarrow P(2.99 < X < 3.01)$$

$$= P(-2.0 < Z < 2.0)$$

$$= 1 - 2 * P(Z < -2.0)$$

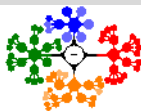

$$= 1 - 2 * 0.0228 = 0.9544$$

**Figure:** Area for Example 6.9.

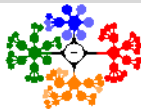

## Applications of the Normal Distribution IV

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .

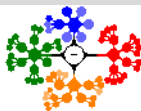

## Applications of the Normal Distribution IV

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .
- It is known that this measurement is normally distributed with mean  $\mu = 1.50$  and standard deviation  $\sigma = 0.2$ .

## Applications of the Normal Distribution IV

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .
- It is known that this measurement is normally distributed with mean  $\mu = 1.50$  and standard deviation  $\sigma = 0.2$ .
- Determine the value  $d$  such that the specifications cover 95% of the measurements.

## Applications of the Normal Distribution IV

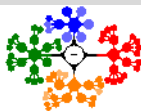

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .
- It is known that this measurement is normally distributed with mean  $\mu = 1.50$  and standard deviation  $\sigma = 0.2$ .
- Determine the value  $d$  such that the specifications cover 95% of the measurements.
- Solution:

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .
- It is known that this measurement is normally distributed with mean  $\mu = 1.50$  and standard deviation  $\sigma = 0.2$ .
- Determine the value  $d$  such that the specifications cover 95% of the measurements.
- Solution:

From Table A.3 we know that

$$P(-1.96 < Z < 1.96) = 0.95$$

$$1.96 = \frac{(1.50 + d) - 1.50}{0.2}$$

$$\Rightarrow d = 0.2 * 1.96 = 0.392$$

## Applications of the Normal Distribution IV

- **Example 6.10:** Gauges are used to reject all components where a certain dimension is not within the specification  $1.50 \pm d$ .
- It is known that this measurement is normally distributed with mean  $\mu = 1.50$  and standard deviation  $\sigma = 0.2$ .
- Determine the value  $d$  such that the specifications cover 95% of the measurements.
- Solution:

From Table A.3 we know that

$$P(-1.96 < Z < 1.96) = 0.95$$

$$1.96 = \frac{(1.50 + d) - 1.50}{0.2}$$

$$\Rightarrow d = 0.2 * 1.96 = 0.392$$

- Assuming that the resistance follows a normal distribution and can be measured to any degree of accuracy, what percentage of resistors will have a resistance exceeding 43 ohms?
- **Solution:**

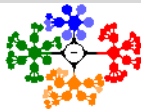

From Table A.3 we know that

$$z = \frac{43 - 40}{2} = 1.5$$

$$\begin{aligned} P(X > 43) &= P(Z > 1.5) \\ &= 1 - P(Z < 1.5) = 1 - 0.9332 \\ &= 0.0668 \end{aligned}$$
